

Curated Video Highlights

The visually interesting PURSUE clips people actually noticed

Analysis of PURSUE Release 01 · PR38 · PR46 · PR28 · PR34 · companion to Sensor Evidence deck

Personal research project designed by Joe, powered by Hermes Agent and GPT-5.5 · 2026

What Outside Viewers Highlighted

This deck replaces the dutiful appendix with a curated visual pass

PR38

Eight-pointed star + trail

Gizmodo · India Today · Reddit/social

Attention score: 5/5

PR46

Football body + projections

Gizmodo · Metabunk aerostat hypothesis

4/5

PR28

SWIR-only / diamond claim

Gizmodo · social reposts

3.5/5

PR34

90° turn claim

Gizmodo · Reddit/social

3/5

Key correction: “visually interesting” is not the same as “more anomalous.” The most compelling visuals are also the best candidates for prosaic sensor/flare/aerostat analysis.

PR38 — The Real Visual Centerpiece

Middle East 2013 · eight-pointed starburst + visible trail

00:29 — strongest starburst / near exit

PR38

Why it matters

Best single visual from the release.

DVIDS: “eight-pointed star with arms of alternating length.”

The trail/plume is visible — not just a dot.

Best clip

00:10–00:30: zoom, star/trail development, bottom-right exit.

Clip: [PR38_star_trail.mp4](#)

PR38 — Star Shape vs Thermal Bloom

The strange visual is real; the “star” may be sensor physics

00:18 — clean star + trail

00:29 — strongest bloom

01:00 — post-cut track

Plausible explanation

India Today argues the most likely prosaic explanation is a parachute illumination flare.

Why that fits visually

- Very hot source in IR
- Star-like optical/thermal blooming
- Visible plume/trail
- Drift/jitter consistent with wind + sensor motion

Caution

This is plausible, not proven from stills alone.

PR46 — Football Body + Three Projections

INDOPACOM 2024 · morphology actually visible enough to discuss

00:02

00:03

00:06

PR46

Vision result

A dark elongated “football” body is reasonably visible.

The three projections are only partial/ambiguous. Outline flicker suggests turbulence, sensor processing, compression, or real deformation.

Best frames

00:02 · 00:03 · 00:06

PR46 Inverted — Aerostat Hypothesis Test

Metabunk: could resemble TARS/JLENS-style surveillance aerostat

00:03 inverted

00:06 inverted

Reference pattern only — not an identification

elongated envelope + fins/payload/tether-like projections?

Assessment

Inversion makes an aerostat-like reading visually plausible at a coarse silhouette level.

But low confidence

- Target is tiny
- No clear tether
- Projections may be artifacts
- Inversion can create pareidolia

Best wording

“Visual plausibility test,” not identification.

PR28 — SWIR-Only Case Is Better Than the “Diamond” Claim

Greece Jan 2024 · 434 kt report · teardrop/loss sequence

00:04 right-frame contrast

00:10 full SWIR

00:55 teardrop/trailing mass

01:00 black-hot no reacq

Vision result

The diamond shape is not clearly demonstrated in stills.

00:55 is the most suggestive morphology: faint inverted teardrop/trailing mass.

00:56–01:05 shows loss / no reacquisition in alternate modes.

Best clip

00:53–01:05 · PR28_teardrop_loss.mp4

PR34 — 90° Turn Claim Requires Motion

Greece Oct 2023 · early 00:04–00:30 segment is the relevant part

00:04 entry

00:07 start

00:12 back/forth

00:19 end

00:30 centered

Do not evaluate from stills — play the 00:04–00:30 clip

Best segment: 00:04–00:30, especially 00:07–00:19.

Stills mark the interval, but cannot prove speed, distance, or 90° turns.

Presentation caption

DVIDS/D33 reports multiple 90-degree turns at ~80 mph near ocean surface.

Caution

The still frames only point to the relevant tracking interval. Kinematics require full-motion playback and sensor metadata.

Clip: PR34_initial_motion.mp4

Companion Clips to Play

The most important evidence is temporal — not static

PR38**PR38_star_trail.mp4****00:10–00:30**

Starburst + visible trail

PR46**PR46_full_clip.mp4****00:00–00:09**

Shape / projections / aerostat test

PR28**PR28_teardrop_loss.mp4****00:53–01:05**

SWIR teardrop + loss/no reacq

PR34**PR34_initial_motion.mp4****00:04–00:30**

Reported 90° turn interval

All clips are packaged in [release-01/06-videos/online-highlighted/clips/](#) — use them alongside the PPTX.

Conclusions & Open Questions

What We Now Know

- ✓ PR38 is the visual centerpiece — eight-pointed starburst + visible trail.
- ✓ PR46 is the best shape / prosaic-hypothesis case; aerostat reading is visually plausible but low-confidence.
- ✓ PR28 is a sensor-modality case (SWIR-only), not a diamond-proof case.
- ✓ PR34 requires motion playback — stills cannot demonstrate the 90°-turn claim.
- ✓ The strongest visuals are also the best prosaic candidates (flare, aerostat, SWIR artifact).

Deck pairing

Use this as the audience-facing deck. The Sensor Evidence deck (PR27, PR36, PR34, PR33, PR21) covers the full sensor-workflow stories.

Open Questions

- ? If PR38 is a parachute illumination flare (per India Today), why does the AARO report not state that explicitly?
- ? Does the PR46 silhouette hold up in original-orientation analyst review, or only inverted?
- ? PR28: why was SWIR the only modality that acquired? What failed in visible?
- ? Could motion analysis of PR34 validate the 90°-turn claim, or is it sensor/operator perception?
- ? Why do visually interesting clips get press attention while the sensor-workflow stories (PR27, PR36) are ignored?

Interpretive discipline

The strongest visuals are not necessarily more anomalous. PR38 may be flare/thermal bloom, PR46 may be aerostat-like, PR34 kinematics require video + metadata. Present as visual-interest cases, not mystery proof.
