303

Frames extracted

7

Cut: low visual value

Purpose

This deck focuses on sensor-behavior evidence — reticles, zooms, lock attempts, modality switches, loss/reacquisition.

What was cut

PR19, PR22, PR23, PR26, PR31, PR32, PR35 — all rated 1–2/5 visual interest. Tiny contrast blobs, static annotation, low-res noise. Their sensor stories are redundant with the 5 kept here.

See also

For the most visually interesting clips (PR38 starburst, PR46 aerostat, PR28 SWIR-only), see the Curated Video Highlights deck.

Caption discipline

Use “area of contrast,” “sensor-designated feature,” “reported lock loss.” Do not label stills as craft, proof of speed, or 90° turns unless directly quoting official text.

PR27 — Full Sensor Lifecycle

D23 · UAE · Oct 2023 · acquisition → track → loss → reacquisition

02:14 zoom

02:30 smooth track

03:50 lock loss

04:30 reacquisition

PR27

D23 · UAE

Strongest complete sensor-behavior story in the release.

Coastline/water → centering → zoom → smooth track → locked.

Erratic motion reported → lock loss → reacquisition.

Target is tiny/faint; evidence is the sensor handling, not the object.

Key takeaway

Best single video case: shows the full operational tracking lifecycle.

PR36 — Reticle Fails to Lock

D38 Range Fouler · Middle East · May 2020 · acquisition → lock failure → modality switch

01:16 zoom — best object

02:10 reticle / acquisition

02:15 modality switch

PR36

D38 · Middle East

Range Fouler report: “solid white object making erratic movements above water.”

01:16 zoom shows a small bright dot — best candidate object.

02:10 reticle/acquisition box appears, but DVIDS says lock failed.

02:15 modality switch; track lost in new mode.

Key takeaway

Best example of attempted vs failed lock, and why mode-switching can lose targets.

PR34 — Maneuver Claim / Sensor Handling

D33 · Greece · Oct 2023 · multiple 90° turns reported at ~80 mph near ocean surface

00:20 centered/tracked

01:30 reticle designation

02:10 contrast filter

02:22 lock lost

PR34

D33 · Greece

The 90°-turn claim is the strongest official maneuver statement.

Stills cannot independently prove turns or speed — that requires motion.

Frames show reticle/filter/lock-loss; sensor workflow, not object identity.

Object itself is tiny and faint across the sequence.

Key takeaway

Important as a report claim; still frames are sensor-behavior context, not kinematic proof.

PR33 — Glare/Bloom vs Object Question

D32 · Syria · Oct 2024 · three clips of “misshapen ball of white light” event

00:01 orange/red region

00:02 persistence

PR32 comparison

PR31 context

PR33

D32 · Syria

D32 is a 3-clip cluster: PR31/PR32 weakly visible; PR33 most striking.
PR33 shows prominent orange/red semi-transparent blob near a ground feature.
Best interpretation: possible glare, bloom, color-channel artifact, or sensor overlay.
Visually interesting but low-confidence — frame as artifact-comparison slide.

Key takeaway

Good example of why visual impact $\neq$ evidentiary strength in sensor footage.

PR21 — Aircraft Assessment → Unresolved

D14 · Iraq · May 2022 · “probable SU-27/35” yet AARO still unresolved

00:05 two contrast sources

00:07 persistence

00:09 continuity

PR21

D14 · Iraq

Most interesting because of report-vs-status tension, not imagery.

“Probable SU-27/35” was the initial field assessment.

AARO still lists it as unresolved — why does a likely aircraft stay unresolved?

No resolved aircraft silhouette in sampled stills: two small contrast sources.

Key takeaway

Important for institutional-behavior questions, not object morphology.

Conclusions & Open Questions

Sensor evidence lessons from the video release

What we learned

- ✓ Sensor-behavior evidence is stronger than object morphology in these clips.
- ✓ PR27 is the best full sensor-lifecycle story (acquisition through reacquisition).
- ✓ PR36 is the best lock-failure / modality-switch case.
- ✓ PR34 has the strongest official claim but weakest still-frame object clarity.
- ✓ PR33 is striking but best framed as artifact/bloom comparison.
- ✓ PR21 raises the most interesting institutional question (aircraft assessed but unresolved).

Audience guidance

Pair this deck with the Curated Video Highlights deck for PR38/PR46/PR28 visuals.

Open questions

- ? Why do conventional initial assessments (SU-27/35) still end in unresolved status?
- ? Are D32 orange/white regions physical, glare, bloom, or processing artifacts?
- ? Do full-motion clips validate PR34 speed/turn claims better than stills?
- ? What sensor metadata (range, altitude, frame rate) is missing from public releases?

Recommended next asset

Short 5–10s video loops for PR27, PR34, and PR36 would show temporal tracking behavior still frames cannot.
